Research on Sawfish Sword

Jacob Caldwell
Harold Butner
Department of Physics and Astronomy

Scottie Pendleton, Lab Manager Madison Accelerator Lab, Department of Physics and Astronomy

> Ginny Soenksen, Director Madison Art Collection, Lisanby Museum

Where We Do The Imaging

Found over at Madison Hall, at the corner of E Grace Street and S Mason Street, across from the Student Success Center

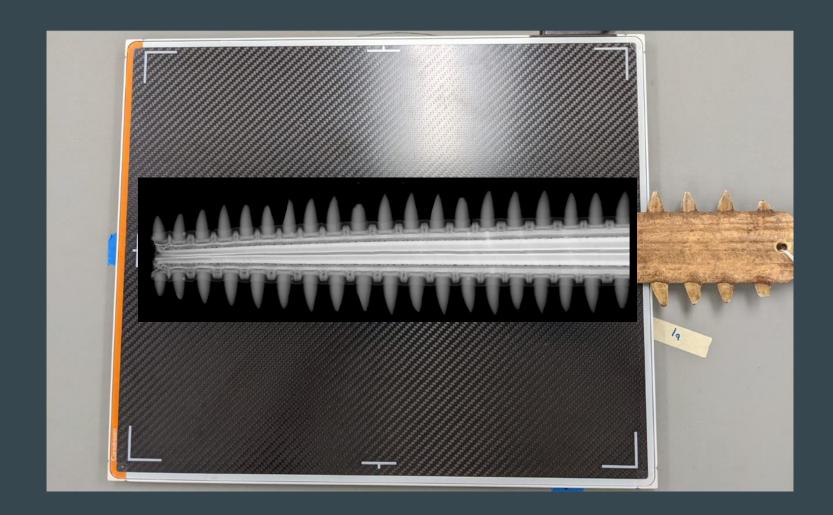

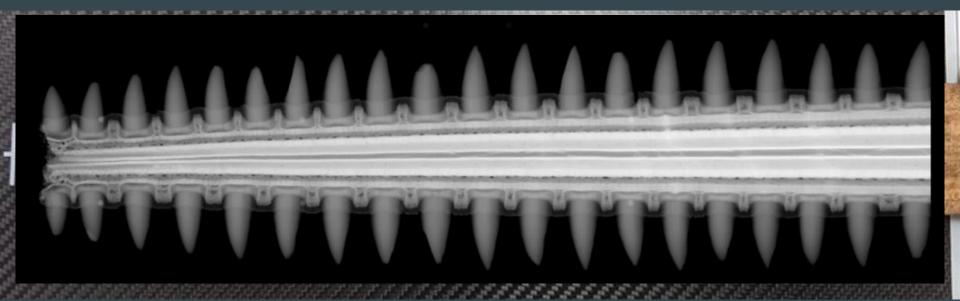

Where We Do The Imaging

- Formerly a medical X-ray machine that has been repurposed by the Department of Physics and Astronomy
- 2-D X-ray imaging uses 40-140 kV
- Allows for imaging down to 0.1 mm spatial resolution

Why it's important to study the sword

- It is important to understand how and why a piece of art is created
- What is the story of the sword?
- What is its purpose?
 - Ceremonial? Combat? Tourism?

What We Knew From The Start

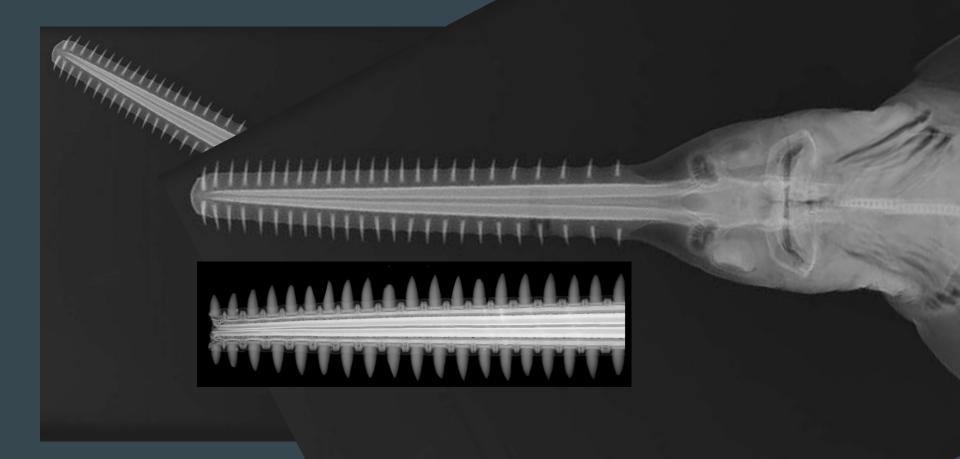

- Arrived as part of a collection
- History of the sword was not well known
- X-ray imaging at 100 kV energy, just to see what we could see
- We were initially puzzled by what we saw

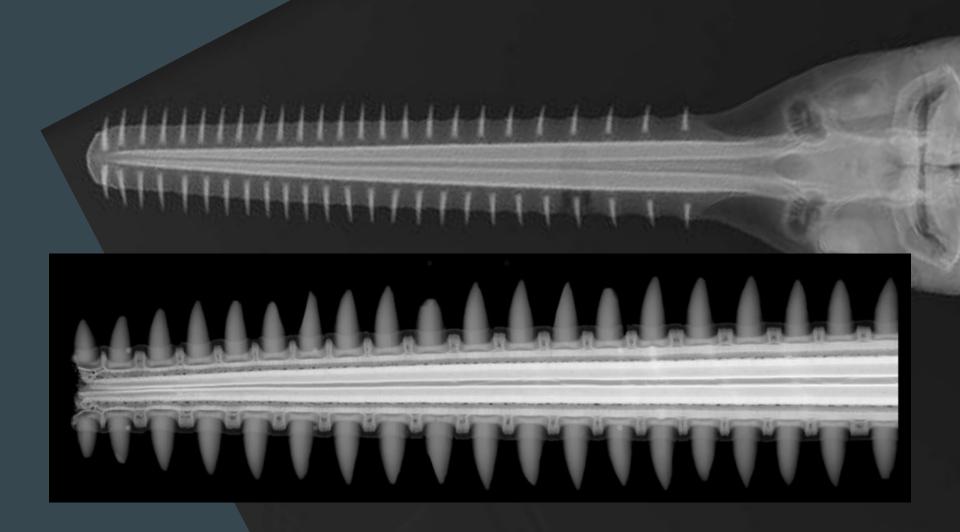

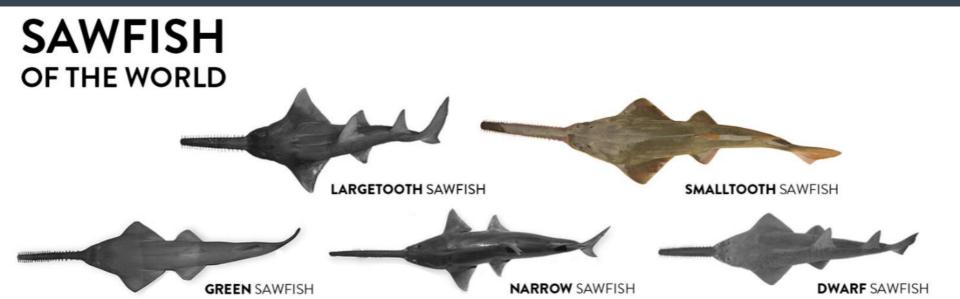

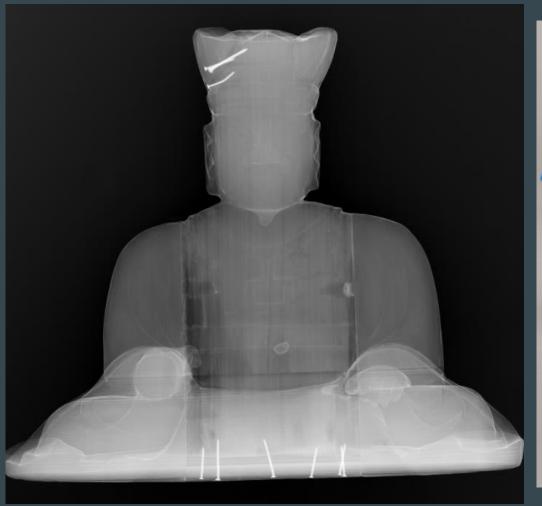

Where We Plan To Go Next

- Going back to gather more accurate measurements on the sword
 - Length and width
 - Mass
 - Size of teeth
- More X-ray imaging: 3d imaging through rotation of the sword
- Modeling the sword in a 3d environment
- Look at similar items in the collection
